

DEC 2024  
[07 BENG - 3145]

7. (a) What are the limitations of access links? How displays solve those issues? Explain an example. (7)

(b) General Code for the following three-address statements assuming a and b are arrays whose elements are 4-byte values: (7)

$x = a[i]$

$y = b$  Explain the activities of caller and callee in stack [j]

$a[i] = y$

$b[j] = x$

8. (a) Discuss about copy propagation and dead code elimination. (7)

(b) With suitable examples, explain about live-variable analysis. (7)

III/IV B.Tech. DEGREE EXAMINATION.

First Semester

Computer Science and Engineering

COMPILER DESIGN

(Effective from the admitted batch of 2022–2023)

Time : Three hours

Maximum : 70 marks

Question No.1 is compulsory.

Answer any FOUR from the remaining questions.

All questions carry equal marks.

PART – A (14 marks)

1. (a) Copy propagation leads to dead-code elimination, justify this with example.  
(b) Give three-address code for the statement:  
 $do i = i + 1; while (a[i] < v);$   
(c) What is syntax-directed definition?  
(d) What is the purpose of Loader/Linker in language processing?

- (e) What are the basic functions of the memory manager?
- (f) What is a preprocessor? Mention its objectives.
- (g) Write about the sub-division of run-time memory.
4. (a) Discuss about the principal sources of optimization with examples. (7)
- (b) Explain in brief about the DAG based local optimization. (7)
5. (a) Generate the flow-graphs for the following expressions: (7)
- $$S \rightarrow id := E \mid S; S \mid \text{if } E \text{ then } S \text{ else } S \mid \text{do } S \text{ while } E.$$
- E  $\rightarrow$  id + id | id
- (b) Define garbage collection is important for code optimization? Explain garbage collection by using reference counting. (7)
6. (a) What is an LL(1) grammar? Can you convert every context free grammar into LL(1). (7)
- (b) Consider the following grammar (7)
- $$\begin{aligned} E &\rightarrow T+E \mid T \\ T &\rightarrow V^*TV \end{aligned}$$
- S  $\rightarrow$  aAd | bBd | aBc | bAc
- A  $\rightarrow$  e
- B  $\rightarrow$  e where a, b, c, d, e are terminals.
- (b) Give the SDT scheme for desk calculator. (7)

III/IV B.Tech. DEGREE EXAMINATIONS

First Semester

Computer Science and Engineering

**COMPILER DESIGN**

(Effective from the admitted batch of 2021-2022)

Time : Three hours      Maximum : 70 marks

First question is compulsory.

Answer any FOUR questions from the following.

All the questions carry equal marks.

1.
  - (a) Define Cross Compiler.
  - (b) What is input buffering?
  - (c) Explain the Concept of predictive parsing.
  - (d) What is type propagation?
  - (e) Discuss branch optimization.
  - (f) Define object code.
  - (g) What is heap management?

[07 BENG - 3122]

2007

2. (a) Explain about boot strapping in Compilers.  
(b) What is a symbol table and why it is important in a compiler explain.
3. (a) Describe the concept of a deterministic finite automation [DFA] in detail.  
(b) What is the primary role of lexical analysis in the compilation process? Explain.
4. (a) Explain shift reduce parsing with an example.  
(b) Discuss about Recursive Descent parsing with an example.
5. (a) Provide examples of intermediate code representation used in Compiler Construction.  
(b) Discuss about type checking and type conversion with examples.
6. (a) Explain the process of dead code elimination in a program.  
(b) Explain the importance of loop optimization in improving program performance.

7. (a) What role does the instruction cache play in code scheduling and performance Optimizations explain in-details with a neat diagram?  
(b) Consider the following grammar :  
$$E \rightarrow T + E \mid T$$
$$T \rightarrow V^* T \mid V$$
$$V \rightarrow id$$

Write down the procedures for the non-terminals of the grammar to make a recursive descent parser.
8. (a) Describe various approaches to organize a symbol table.  
(b) Explain about inherited and synthesized attributes.

[07 BENG - 3122]

III/IV B.Tech. DEGREE EXAMINATION

First Semester

Computer Science and Engineering

COMPILER DESIGN

(Effective from the admitted batch of 2020-2021)

Time : Three hours Maximum : 70 marks

First question is compulsory.

Answer any FOUR questions from the following:

All questions carry equal marks.

1.
    - (a) Define boot strapping in the context of Compiler design.
    - (b) Write the types of language processing system.
    - (c) Write short notes on recursive descent parsing.
    - (d) Write a briefly about an intermediate code.
    - (e) Write short notes on peephole optimization.
    - (f) Describe the concept of program and instruction costs in code generation.
    - (g) Write about Error handling routines.

Ti

1.

2. (a) Define compiler. Describe the phases of a compiler with a neat sketch.
- (b) Explain how input buffering helps lexical analyser in compilation process.
3. (a) State and explain the rules used to construct the LR(1) items.  
(b) What is an LL(1) grammar? Can you convert every context free grammar into LL(1).
4. (a) How does bottom-up parsing differ from top-down parsing?  
(b) Find whether the following grammar is LL(1) or not

$$S \rightarrow absa \mid aaAb, A \rightarrow baAb \mid b$$

5. (a) Explain the Concept of three-address code and its role in intermediate code generation.  
(b) Write procedure to construct CLR parsing table.
6. (a) How do different optimization techniques affect the trade-off between code size and Execution speed.  
(b) What is machine independent optimization? What are the different techniques used for it?

2.

7. (a) What are the trade-offs between generating compact code and generating code for speed?  
(b) Write the algorithm to generate basic blocks and flow graph for quick sort algorithm.
8. Explain the following two classes of local machine independent transformations
  - (a) Structure preserving transformations
  - (b) Algebraic transformations

Computer Science and Engineering  
First Semester**

**COMPILER DESIGN**

(Effective from the admitted batch of 2020-2021)

Time : 3 hours

Max. Marks : 70

**Question No. 1 is compulsory.  
Answer any FOUR from the remaining.  
All questions carry equal marks.**

1. (a) Define regular expression with an example.  
(b) Define the terms token and lexeme.  
(c) Explain the role of Parser in compiler model.  
(d) Define type checking and write the rules for type checking.  
(e) Write about dead code elimination.  
(f) What is a simple target machine model?  
(g) What are the key components of an error handling system in a compiler?
2. (a) Describe the lexical analysis phase in the context of compiler construction.  
(b) Write a regular expression for identifiers and reserved words. Design the transition diagrams for them.

- (e) Define e-closure.  
(f) What language does  $S \rightarrow aSa \mid bSb \mid c$  generate?  
(g) What is ICAN? Explain.

**(P.T.O.)**

## [ 07 BENG - 3122 ]

3. (a) Write the limitations of recursive parser with an example of grammar.
- (b) Write an algorithm to find LR (0) items and give an example.

4. (a) Discuss the advantages and disadvantages of LL(1) and LR(1) parsing.
- (b) Eliminate the left recursion from the following grammar.

$$S \rightarrow Bb \mid a.$$

$$B \rightarrow Bc \mid Sd \mid c$$

5. (a) What is the role of Semantic analysis in the compilation process, and how does it differ from syntax analysis.
- (b) Discuss the concept of back patching with an example.

6. (a) What is loop inversion, and when is it applied for optimization?
- (b) Draw the DAG for the following expression.

$$a + (b * d) + c * (b * d) + e + a / (b * d).$$

7. What are main issues in code generation within a compiler and define a simple target machine model used in code generation.

8. (a) Explain about inheritance and synthesized attributes.
- (b) What is data flow analysis? Explain its role in code of imagination.

[07 BENG - 3212]

[07 BENG - 3212]

III/IV B.Tech. DEGREE EXAMINATION

Second Semester

Computer Science and Engineering

COMPLIANT DESIGN

(Effective from the admitted batch of 2019-2020)

Time : Three hours Maximum : 70 marks

First Question No.1 is Compulsory.

Answer any FOUR from remaining questions.

All questions carry equal marks.

Answer ALL parts of any question at one place

1. Answer the following in brief:

  - (a) What are the uses of cross compilers?
  - (b) Determine whether the following regular expression define the same language.  
 $(ab)^*$  and  $a^*b^*$
  - (c) Is macro processing a phase in compilation?  
Justify your answer.
  - (d) What is left-factoring? Explain.
  - (e) Define e-closure.
  - (f) What language does the grammar  
 $S \rightarrow aSa \mid bSb \mid c$  generate?
  - (g) What is ICAN? Explain.

## [07 BENG - 3212]

2. Define compiler and explain various phases of compiler in detail. Also write down the output for the following expression after each phase.  
 $a := b * c - d$ .
3. (a) Explain the role of Lexical analysis and the issues with lexical analyser.  
 (b) Explain the general format of LEX program with example.
4. (a) Construct the predictive parser for the following grammar :

$S \rightarrow (L) \mid a$   
 $L \rightarrow L, s \mid s$ .

Construct the behaviour of the parser on the sentence (a, a) using the grammar specified above.

- (b) Analyse whether the following grammar is LR(1) or not. Explain your answer with reasons.

$S \rightarrow L, R$   
 $S \rightarrow R$   
 $L \rightarrow *R$   
 $L \rightarrow id$   
 $R \rightarrow L$

8. (a) Optimize the following loop and also construct flow graph:

5. Consider the grammar given below :

$$\begin{aligned} E &\rightarrow E + T \\ E &\rightarrow T \\ T &\rightarrow T * F \\ T &\rightarrow F \\ F &\rightarrow (E) \\ F &\rightarrow id \end{aligned}$$

Prepare LR Parsing table for the above grammar.  
 Give the moves of LR Parser on  $id * id + id$ .

Also explain error recovery in LR parsing.

6. (a) Explain different schemes of storing name attribute in symbol table.  
 (b) Describe the method of generating syntax directed definition of control statements.
7. (a) Explain the principle sources of code optimization in detail.  
 (b) Explain the DAG representation of the basic block with example.
8. (a) Efficient code generation requires the remember of internal architectural of the target machine. Justify your answer with an example.  
 (b) How the instruction forms effect the computation time? Explain.

8. (a) Optimize the following loop and also construct flow graph:

```
Begin  
    Prod = 0  
    i = 1  
    do  
        Begin  
            Prod = Prod + a[i] * b[i]  
            i = i + 1  
        End  
        While (i < 20);  
    End
```

4 [07 BENG - 3209] (C-19)

2. Define compiler and explain various phases of compiler in detail. Also write about the various stages of compilation.

### [07 BENG - 3209] (C-19)

III/IV B.Tech. DEGREE EXAMINATION.

Second Semester

Computer Science Engineering

COMPILER DESIGN

(Common with IT)

(Effective from the admitted batch of 2015-2016)

For the academic year 2020-2021 batch only

Time : Three hours

Maximum : 70 marks

First Question is compulsory

Answer any FOUR questions from the remaining.

Write all parts of any question at one place.

1. (a) Write regular expression over alphabet {a, b, c} containing at least one 'a' and at least one 'b'.  
(b) What is meant by pass and phase?  
(c) What is left factoring?  
(d) Define handle pruning.

**VIT B.Tech. DEGREE EXAMINATION.**

Second Semester

- (e) What is Absolute Syntax tree? Give an example.
- (f) Define constant folding.
- (g) What are the rules to identify Leader basic blocks?
- (a) Show the output produced by different stages in compiler for the expression  $a = b^*c/36$ , where  $a$ ,  $b$  and  $c$  are real numbers.
- (b) Explain bootstrapping a compiler with suitable diagrams.
3. (a) Construct DFA from the following NFA:  

Present State	Next State
$p$	{ $p, q$ }
$q$	{ $r$ }
$r$	{ $s$ }
$s$	{ $s$ }
- (b) Write about three type expressions.
7. (a) Generate address code for the following switch block:  

```

Switch(ch)
{
    Case 1: c = a + b;
    Case 2: c = a - b;
    Case 3: C = a * b;
}
break;
break;
break;
}

```
- (b) Translate the expression  $(a + b) / (c + d) * (a + b) / (c + d)$  into quadruples, triples and indirect triples.
8. 107 BE NG - 32091 (C-19)
- (a) Computer FIRST and FOLLOW of the following grammar:
- $S \rightarrow aBDh, B \rightarrow cC, C \rightarrow bc | e, D \rightarrow EF,$
- $E \rightarrow g | e, F \rightarrow f | e.$
- (b) Design CLR Parser for the following grammar.
- $S \rightarrow L = R | R$
- $L \rightarrow L$
- $R \rightarrow *R | a$
6. (a) Write about syntax directed definition and syntax directed translation.
- (b) Describe about type expressions.
7. (a) Generate three address code for the following switch block:
- $Switch(ch)$
- {
- Case 1:  $c = a + b;$
- Case 2:  $c = a - b;$
- Case 3:  $C = a * b;$
- }
- break;
- break;
- break;
- }
- (b) What is the structure of LEX program? Write LEX program that accepts the keywords "begin", "if", "else" and identifier "abc".
2. 107 BE NG - 32091 (C-19)

III/IV B.Tech. DEGREE EXAMINATION

Second Semester

Computer Science and Engineering

COMPILER DESIGN

(Common with Information Technology)

(Effective from the admitted batch of 2015–2016)

First Question is compulsory.

Answer any FOUR from the remaining questions.

All questions carry equal marks

Answer all parts of any question at one place.

1. (a) Define a compiler and list the phases of a compiler.

(b) What is meant by a transition diagram? Give an example.

(c) What are the problems with Top-down parsing?

(d) Construct a syntax tree for the arithmetic expression  $a^* - (b+c)$ .

## [07 BE NG - 3209]

III/IV B.Tech. DEGREE EXAMINATION.

Second Semester

7. (a) Define DAG and give an example.  
     (b) Discuss various strategies used in register allocation and assignment.
- (c) Which object code form makes the code generation process easier and why?
8. (a) Explain about code generators.  
     (b) List out the contents of a symbol table.
- (c) Explain about compiler construction tools.
9. (a) Construct DFA for the regular expression  $(11+0)^*(00+1)^*$ .  
     (b) Explain about Lexical analysis.
10. (a) Explain Shift-reduce parsing with an example.  
     (b) Discuss about Recursive Descent Parsing.
11. (a) Translate the arithmetic expression  $a = b = c + d = c$  into Postfix notation  
         (i) Syntax tree   (ii) Postfix notation  
         (iii) Three-address code.
- (b) Discuss about Type Checking and Type conversions.
12. (a) Discuss basic blocks and flow graphs with an example.  
     (b) Explain machine dependent code optimization techniques.

ALL questions carry equal marks.

1. (a) What is meant by boot strapping?  
(b) Mention the disadvantages of lexical analysis.  
(c) What is the classification of top-down parsing?  
(d) What is meant by syntax tree?  
(e) Explain flow graph.  
(f) What is meant by register allocation?  
(g) Describe about lexical phase errors.

7. (a) Discuss in detail about loop optimization techniques. (7)  
 (b) Briefly explain about semantics preserving with an example. (7)

2. (a) Discuss about the compiler construction tools.  
 (b) Describe about code generation algorithm.

- (b) Explain the various phases of a compiler with a neat sketch.  
 (b) Explain issues in code generation.

3. (a) Explain how translation diagram is helpful in lexical analyzer.  
 (b) What is compiler? Explain the role of lexical analyzer?

4. (a) Construct predicate parser for the following grammar and verify whether the string is accepted by it or not.  

$$S \rightarrow AAB \mid Bba$$
  

$$A \rightarrow e$$
  

$$B \rightarrow e$$

5. (a) Discuss about syntax directed definition and syntax directed translation.  
 (b) Explain error recovery in predictive parsing.  
 (b) Explain type checking and type conversions.  
 6. (a) Explain DAG and its use. Write the procedure to construct the DAG for a statement.  
 (b) Discuss about data flow analysis of structured programs.

Computer Science Engineering

COMPILER DESIGN

(Common with B.Tech. Information Technology)

(Effective from the Admitted Batch of 2006-2007)

Time : Three hours

Maximum : 70 marks

Q.No. 1 which is compulsory.

Answer any FOUR questions from the remaining.

Answer ALL parts of any question at one place.

1. (a) Define regular expression. Find a regular expression for the language  $L = \{a^n b^m \mid n \geq 0, m \geq 1\}$ . ( $7 \times 2 = 14$ )  
(b) List the phases of a compiler.  
(c) Define lexical error with an example.  
(d) State and define the conflicts that occur in shift-reduce parsing.

[07 - 3216]

- (a) Explain different phases of a compiler with a neat diagram, showing the output of each phase, using the statement  $a = a * 5 + b + 2$ . (Assume that  $a$  and  $b$  are floating point numbers)
- (b) Illustrate the differences between Compiler and Interpreter.
- (c) Write down the implementation of three address code and translate the following expressions into quadruple, triple and indirect triple. (7)

$*q_3$	$q_2$	$q_1$
$*q_2$	$q_3$	
$\leftarrow$	$q_1$	$q_2$

2. (a) Obtain a regular expression for the following finite automata.
- (b) Design an NFA and DFA accepting all strings ending with 01 over an alphabet  $\{0, 1\}$ .
- (c) Explain different phases of a compiler with a neat diagram, showing the output of each phase, using the statement  $a = a * 5 + b + 2$ . (Assume that  $a$  and  $b$  are floating point numbers)
- (d) Illustrate the differences between Compiler and Interpreter.
- (e) What is S-attribute definition?
- (f) What is strength reduction?
- (g) List the issues in the design of a code generator.
- (h) Construct SLR parsing table for the following grammar.
- (i) Compute the FIRST and FOLLOW sets for the following grammar:
- $S \rightarrow iE \cdot S \mid a$
- $E \rightarrow eS \mid E$
- $A \rightarrow d$
- (j) Design an NFA and DFA accepting strings ending with 01 over an alphabet  $\{0, 1\}$ .
3. (a) Define Syntax-Directed Definition. Give SDD of a simple desk calculator and construct annotated parse trees for the following expressions.
- (b) Write down the implementation of three address code and translate the following expressions into quadruple, triple and indirect triple. (7)
4. (a) Discuss about tokens, patterns and lexemes with suitable examples. (8)
- (b) Explain in detail about the role of lexical analyzer.
5. (a) Construct SLR parsing table for the following grammar.
- $S \rightarrow A \cdot A \mid bAC \mid dc \mid bda$
- (b) Compute the FIRST and FOLLOW sets for the following grammar:
- $S \rightarrow iE \cdot S \mid a$
- $E \rightarrow eS \mid E$
- $A \rightarrow d$
- (c) Obtain a regular expression for the following finite automata.
- (d) List the issues in the design of a code generator.
- (e) Write down the implementation of three address code and translate the following expressions into quadruple, triple and indirect triple. (7)
6. (a) Write down the implementation of three address code and translate the following expressions into quadruple, triple and indirect triple. (7)

(e) What is S-attribute definition?  
(f) What is S-attribute definition?

6. (a) Write down the implementation of three address code and translate the following expressions into quadruple, triple and indirect triple. (7)  
 $-(a+b)*(c+d)*(a+c)$   
(b) Discuss about loop optimization techniques. (7)
7. (a) What is a basic block and flow graph? Write the algorithm to partition the TAC into basic blocks. Explain the construction of a flow graph with an example. (7)  
(b) Write the algorithm for determining the liveness and next-use information for each statement in a basic block. Explain the algorithm with an example. (7)
8. (a) Discuss about machine dependent (peephole) optimization. (7)  
(b) Discuss in detail about Garbage Collection. (7)

Second Semester

Computer Science and Engineering

COMPILER DESIGN

(Common with B.Tech. Information Technology)

(Effective from the admitted batch of 2006-2007)

Time : Three hours

Maximum : 70 marks

Q.No. 1 which is compulsory.

Answer any four questions from the remaining.

Answer all parts of any question at one place.

( $7 \times 2 = 14$ )

1. (a) Design a DFA that accepts set of all strings containing even number of 0's and odd number of 1's over an alphabet {0, 1}.  
(b) What is the purpose of symbol table in a compiler?  
(c) Differentiate between a pass and a phase.  
(d) What is Reduce-Reduce conflict? Give an example.

[07 - 3216]

- (e) List the different types of intermediate representations.
- (f) Differentiate between DAG and syntax tree.
- (g) Determine the costs of the following instruction sequences:
- LD R0, x  
LD R1, y  
SUB R0, R0, R1  
BLTZ R3, R0  
(4 x 14 = 56)

4. (a) Explain about various data structures used in a compiler.  
 $i = i * 70 + j + 2$

- (b) Construct the CLR parsing table for the following grammar. Justify your design with an example.  
 $S \rightarrow CC$   
 $C \rightarrow cC$   
 $C \rightarrow d$

5. (a) Construct SLR parsing table for the grammar and parse the string ()()\$.  
 $S \rightarrow S(S)$   
 $S \leftarrow \epsilon$

- (b) Define Syntax-Directed Definition. Give SDD of a simple desk calculator and construct annotations. expressions.

6. (a) Construct an equivalent DFA for the regular expression  $(0+1)^* 1 (0+1)^*$  using Kleene's theorem. Construct E-NFA for the regular expression  $(0+1) 1 (0+1)^*$  using Kleene's theorem.

- (b) Explain Kleene's theorem. Construct E-NFA for the regular expression  $(0+1)^* 1 (0+1)^*$  using Kleene's theorem.

Second Semester

Computer Science and Engineering

COMPILER DESIGN

(Effective from the admitted batch of 2019–2020)

Time : Three hours

Maximum : 70 marks

First question is compulsory.

Answer any FOUR from the remaining questions.

All questions carry equal marks.

Answer ALL parts of any question at one place.

1. Answer the following in brief :

- (a) List and explain few compiler construction tools.
- (b) Define the term "Tokens" in lexical analysis phase.
- (c) What are the grass of error handleless in a parser?
- (d) Write the advantages and disadvantages of operator precedence parsing.
- (e) How can you generate 3-Address code?

(Effectiveness

3. (a) Explain Shift-reduce parsing. What are the conflicts that may occur during shift-reduce parsing?  
 (b) Explain the syntax directed translation of switch statement.

Compiler for code generation (Effectiveness of three methods)

- (b) For the grammar given below, calculate the operator precedence relation and precedence functions.  
 (a) Code generation algorithm

8. Write short notes on the following:

Compiler code for three effective methods to reduce the latency of the memory access.

- (b) Error handling routines in compilers.

(Effectiveness) For three code snippets, we will compare the performance of the compiler-generated code with the hand-coded version. The first snippet is a simple loop that iterates over an array and calculates the sum of its elements. The second snippet is a more complex loop that performs matrix multiplication. The third snippet is a recursive function that calculates the factorial of a number. In all cases, the compiler-generated code is faster than the hand-coded version. This is because the compiler is able to optimize the code more effectively than a human programmer can. For example, in the matrix multiplication snippet, the compiler is able to use SIMD instructions to perform multiple operations at once, which significantly speeds up the computation. In the factorial snippet, the compiler is able to use tail recursion optimization to eliminate the need for explicit stack frames, which reduces memory usage and improves performance.

- How would you implement the three-address statement? Explain with suitable examples.

(Effectiveness) For the me : Three code for compiler could be t are the ult-reduce late the ecendence address s types .

of types addresses s.  
-E/d

For the code for compiler could be t are the th-reduce illustrate the precedence of address types. -E/d

For code reuse: Three compiler techniques could be used to reduce the overhead of heap allocation. One approach is to use a fixed-size stack-based heap. Another approach is to use a heap manager that allocates memory in large blocks and reclaims it when it is no longer needed. A third approach is to use a hybrid heap that uses both stack-based and heap-based memory management.

[07 BENG - 3209] (C-I95) JUL 2021

III/IY B.Tech. DEGREE EXAMINATION.

Second Semester

Computer Science Engineering

COMPILER DESIGN

(Common with IT)

Effective from the admitted batch of 2015–2016)

For the academic year 2020-2021 batch only

Time : Three hours Maximum : 70 marks

First Question is compulsory

Answer any FOUR questions from the remaining.

Write all parts of any question at one place.

6. (a) How to code  
optimization?  
What are the patterns used for code  
generation?
- (b) What is meant by pass and phase?  
(c) What is left factoring?  
(d) Define handle pruning.
- (a) Write regular expression over alphabet {a, b, c} containing at least one 'a' and at least one 'b'.
- (c) Define context-free grammar.  
(d) List the various forms of three instructions.

(e) What is abstract syntax tree? Give example.

(f) Define constant folding.

(g) What are the rules to identify leader blocks?

2. (a) Show the output produced by different stages in compiler for the expression  $a := b * c$ , where  $a, b$  and  $c$  are real numbers.

(b) Explain bootstrapping a compiler with suitable diagrams.

3. (a) Construct DFA from the following NFA  
 $M = (\{p, q, r, s\}, \{0, 1\}, \delta, p, \{s\})$ .

Present State	Next State	
	0	1
p	{p, q}	{p}
q	{r}	{r}
r	{s}	-
s	{s}	{s}

(b) What is the structure of LEX program? Write a LEX program that accepts the keyword "begin, if, else" and identifier: "abc".

2 [07 BENG - 3209] (C-19)

(a) Illustrate brute force parsing technique with suitable example.

(b) Computer FIRST and FOLLOW of the following grammar:

$$S \rightarrow aBDh, B \rightarrow cC, C \rightarrow bc|\epsilon, D \rightarrow EF, E \rightarrow g|\epsilon, F \rightarrow f|\epsilon.$$

Design CLR Parser for the following grammar.

$$\begin{aligned} S &\rightarrow L = R | R \\ L &\rightarrow ^*R | a \\ R &\rightarrow L \end{aligned}$$

(a) Write about syntax directed definition and syntax directed translation.

(b) Describe about type expressions.

(a) Generate three address code for the following switch block:

```
Switch(ch)
{
    Case 1: c = a + b;
    break;
    Case 2: c = a - b;
    break;
    Case 3: C = a * b;
    break;
}
```

(b) Translate the expression  $(a + b) / (c + d)^* (a + b/c) - d$  into quadruples, triples and indirect triples.

3 [07 BENG - 3209] (C-19)

8. (a) Optimize the following loop and also draw  
flow graph:

```
Begin  
Prod = 0  
i = 1  
do  
    Begin  
        Prod = Prod + a[i] * b[i]  
        i = i + 1  
    End  
    While (i < 20);  
End
```

III/IV B.Tech. DEGREE EXAMINATION.  
Second Semester

Computer Science and Engineering  
**COMPILER DESIGN**

(Effective from the admitted batch of 2019–2020)

Time : Three hours

Maximum : 70 marks

First Question No.1 is Compulsory.

Answer any FOUR from remaining questions.

All questions carry equal marks.

Answer ALL parts of any question at one place

Answer the following in brief :

- (a) What are the uses of cross compilers?
- (b) Determine whether the following regular expression define the same language.  
 $(ab)^*$  and  $a^*b^*$
- (c) Is macro processing a phase in compilation?  
Justify your answer.
- (d) What is left-factoring? Explain.
- (e) Define e-closure.
- (f) What language does the grammar  
 $S \rightarrow aSa \mid bSb \mid c$  generate?
- (g) What is ICAN? Explain.

(c) Define context-free  
(d) List the various

- (a) Discuss about allocation strategies of heap  
allocation and stack allocation.

2

Define compiler and explain various phases  
compiler in detail. Also write down the output  
the following expression after each phase  
 $a := b * c - d$ .

3. (a) Explain the role of Lexical analysis and  
issues with lexical analyzer.  
(b) Explain the general format of LEX proge  
with example.

4. (a) Construct the predictive parser for  
following grammar:  
 $S \rightarrow (L) | a$   
 $L \rightarrow L, S|s$ .

Construct the behavior of the parser on  
sentence (a, a) using the grammar spec  
above.  
(b) Analyse whether the following grammar  
LR(1) or not. Explain your answer w  
reasons.

(a) Efficient code generation requires the  
removal of internal architectural of the  
target machine. Justify your answer with an  
example.

(b) How the instruction forms effect the  
computation time? Explain.

(a) Explain the principle sources of code  
optimization in detail.  
(b) Explain the DAG representation of the basic  
block with example.

(a) Explain different schemes of storing name  
directed definition of control statements.  
(b) Describe the method of generating syntax  
attribute in symbol table.

(a) Explain different error recovery in LR parsing.  
Also explain error recovery in LR parsing.  
Give the moves of LR Parser on  $id * id + id$ .

Prepare LR Parsing table for the above grammar.

# Computer Science and Engineering

## COMPILER DESIGN

(Common with Information Technology)

(Effective from the admitted batch of 2015–2016)

Time : Three hours Maximum : 70 marks

First Question is compulsory.

Answer any FOUR from the remaining questions.

All questions carry equal marks

Answer all parts of any question at one place.

1. (a) Define a compiler and list the phases of a compiler.
  - (b) What is meant by a transition diagram? Give an example.
  - (c) What are the problems with Top-down parsing?
  - (d) Construct a syntax tree for the arithmetic expression  $a * - (b+c)$ .

(c) Define context-free grammar.  
 (d) List the various forms of the instructions.

1. (a) Define DAG and give an example.  
 (b) Which object code form makes the generation process easier and why?  
 (c) List out the contents of a symbol table.  
 (d) Explain about Cross compilers.  
 (e) Describe various approaches to organize a symbol table.  
 (f) Discuss various strategies used in register allocation and assignment.

2. (a) Define DAG and give an example.  
 (b) Explain about DFA for the regular expression.  
 (c) Construct DFA for the regular expression  $(11+0)*(00+1)^*$ .  
 (d) Describe compiler construction tools.  
 (e) Explain about Lexical analysis.  
 (f) Explain Shift-reduce parsing with example.

3. (a) Explain Recursive Descent Parsing.  
 (b) Discuss about LR(0) parser with example.

4. (a) Translate the arithmetic expression  $a = b * c + b * c / d$  into Postfix notation.  
 (b) Discuss about Recursive Descent Parsing.

5. (a) Translate the arithmetic expression  $a = b * c + b * c / d$  into Postfix notation.  
 (b) Three-address code.  
 (c) Syntax tree  
 (d) Syntactic conversions.

6. (a) Discuss basic blocks and flow graphs with examples.  
 (b) Explain machine dependent code optimization techniques.

COMPLIER DESIGN

(Common with Information Technology)

(Effective from the admitted batch of 2015–2016)

Time : Three hours Maximum : 70 marks

First question is compulsory.

Answer any FOUR from the remaining questions.

All questions carries equal marks.

Answer all parts of any question at one place.

1. Answer the following in brief:

- (a) Finite automata.
  - (b) LR (K) parsing.
  - (c) Type conversion and type checking.
  - (d) Local optimization.
  - (e) Loop inversion.
  - (f) Lexical phase errors.
  - (g) Code generator.

- (c) Define context-free grammar.
  - (d) List the various forms of the instructions.

- statements, explain with suitable examples.
5. (a) Discuss about allocation strategies of Heap allocation and stack allocation.  
 (b) What is Activation record? Explain the purpose of different fields in an activation record.

- (d) List the various forms of three address instructions. What is Give an example.
2. (a) Explaining different phases of compilation process? Explain what are the various attributes of symbol table? Discuss about ordered and unordered symbol tables.
- (b) What is the function of symbol table in compilation process? Explain example of the output of each phase. Positon : = initial + rate \* 60
- (c) Ambiguities for the grammar? Eliminate ambiguities for the grammar.
- (d) What is ambiguous grammar? Eliminate ambiguities for the grammar.
3. (a) Construct SLR parsing table for following grammar  
 $E \rightarrow E + E | E * E | (E) | id$   
 $S \rightarrow AS | b$   
 $A \rightarrow SA | a$   
 $T \rightarrow TF | T$   
 $F \rightarrow F | a | b$
- (b) What is recursive descent parser? Consider recursive descent parser for the following grammar.
- (c) Code generation from DAG.
- (d) Write short notes on the following:
- (a) Brute force parsing  
 (b) 3-Address code  
 (c) Code generation from DAG.
4. (a) Write the quadruple, triple, indirect for the statement  $a = b + c - c$ .  
 (b) Explain the role of intermediate generator in compilation process.
5. (a) Describe various register allocation techniques.  
 (b) What is code optimization? Discuss the advantages? Disadvantages?
2. Optimizing the code.

Second Semester

Computer Science Engineering

COMPILER DESIGN

(Common with Information Technology)

(W.E.F. 2015-16 A.B.)

Time : Three hours Maximum : 70 marks

Q. No. 1 which is compulsory.

Answer any FOUR questions from the remaining.

$$(7 \times 2 =$$

$$(7 \times 2 = 14)$$

1.

  - (a) Define bootstrapping.
  - (b) Design finite automata for an unsigned number.
  - (c) Define context-free grammar.
  - (d) List the various forms of three address instructions.
  - (e) What is a basic block? Give an example.
  - (f) Differentiate register allocation and register assignment.
  - (g) List the common semantic errors.

MC 7/1

WPS PPT (GIF) PPT

[07 BE NG - 3209]

2. (a) Explain about the structure of a compiler with a neat diagram.  
(b) Discuss in detail about compiler construction tools.
3. (a) What are the approaches to design lexical analyzers? Explain.  
(b) What is regular definition? Give a regular definition for Pascal identifier and also design finite automata for the same.
4. (a) What is brute force parsing? Explain with an example.  
(b) Construct SLR parsing table for the following grammar.
5. (a) Write a syntax directed translation scheme that converts infix expression to the corresponding postfix expression. Explain with an example.  
(b) Write an attributed grammar (SDD) for simple expressions and also construct the syntax tree for the following expressions using the SDD  $a + (b * c)$ .
6. (a) What are the applications of DAG?  
(b) Enumerate the process of local optimization.
7. (a) Briefly discuss about Simple Target Machine Model.  
(b) What are the issues in the design of code generator? Explain.
8. (a) Discuss in detail about the implementation of a simple stack allocation.  
(b) Explain about Block Structured Languages.
9. (a) What is brute force parsing? Explain with an example.  
(b) Construct SLR parsing table for the following grammar.
10. (a) Write a syntax directed translation scheme that constructs trees for simple expressions using the syntax trees for simple expressions and also construct the syntax tree for the following expressions using the SDD  $a + (b * c)$ .

## COMPILER DESIGN

(Common with Information Technology)

(Effective from the admitted batch of 2015–2016)

Time : Three hours

Maximum : 70 marks

First question is compulsory.

Answer any FOUR from the remaining questions.

All questions carry equal marks.

Answer ONE question from each Unit.

Answer all parts of any questions at one place.

1. (a) Give the regular definition for unsigned numbers.  
(b) List compiler construction tools.  
(c) Write an algorithm for left factoring a grammar with example.  
(d) What is Annotated parse tree? Draw Annotated parse tree for the expression  $(2 + 3)*5$  with suitable grammar.

- (e) What is Three – Address Code? Draw DAG and its corresponding Three-Address code for the expression  $a + a * (b - c) + (b - c) * d \dots$
- (f) What is type checking? Discuss their types in brief.
- (g) What is Copy Propagation?
2. (a) What is DFA? Construct DFA for the given regular expression  $(a \mid b)^* abb$ .
- (b) Write notes on the Lexical – Analyzer Generator Lex.
3. (a) Construct predictive parsing table for the following grammar:
- $$\begin{array}{l} S \rightarrow E \\ E \rightarrow TE' \\ E' \rightarrow +E' \mid -E' \mid \in \\ T \rightarrow FT' \\ T' \rightarrow *T \mid T \mid \in \\ F \rightarrow num \mid id. \end{array}$$
4. Give the algorithm for LALR parsing table. Describe state diagram and construct parsing table for the grammar :
- $$\begin{array}{l} S \rightarrow CC \\ C \rightarrow cC \\ C \rightarrow d. \end{array}$$
5. (a) What is the role of Dependency graphs in evaluating SDDs?
- (b) Draw and explain the annotated parse tree for the expression  $3^* 5$ , and its associated Dependency graph for the grammar given below :
- $$\begin{array}{l} T \rightarrow FT' \\ T' \rightarrow *FT' \\ T' \rightarrow \epsilon \\ F \rightarrow digit. \end{array}$$
6. Explain about various methods of implementing Three – Address instructions.
7. (a) What is Peep-Hole optimization? Explain.
- (b) How Branch Optimization is achieved in the final machine code of program fragment?

4. (a) State the rules to construct FIRST and FOLLOW sets.  
What are the rules to construct FIRST and FOLLOW functions?

8. (a) What are semantics – preserving transformations in optimizing a code?  
Discuss with quick sort method.
- (b) How global common sub expressions are eliminated in optimizing a code? Discuss with quick sort method.

COMPILER DESIGN

(Common with Information Technology)

(Effective from the admitted batch of 2015–2016)

(For the Academic Year 2020-2021 batch only)

Time : Three hours Maximum : 70 marks

First Question is compulsory

Answer any FOUR questions from the remaining.

Write all parts of any question at one place.

1. (a) Define bootstrapping of a compiler.  
(b) How does lexical analyzer help in the process of compilation?  
(c) Give the structure of LEX program.  
(d) Define left recursion. How to eliminate left recursion from CFG?

6. Show that the grammar  $G : S \rightarrow SS \mid aSb \mid bsa \mid \epsilon$  is ambiguous.
- (f) Define syntax directed translation.
- (g) Define loop invariant. Give an example.
2. (a) What are different analysis phases of compiler? Explain the reasons for separation of lexical analysis from syntax analysis.
- (b) Describe compiler construction tools with example.
3. (a) Construct DFA for the regular expression:  $(0+1)^* 011$ .
- (b) Construct finite automata that accepts tokens: identifiers, decimal constants and integer constants.
4. (a) What is input buffering? Describe different input buffering schemes.
- (b) Write a procedure to compute FIRST and FOLLOW of the grammar.
5. Construct predictive parsing table for the following grammar and verify the string  $(a+a)$  is accepting or not
- $$E \rightarrow E + T \mid T \quad T \rightarrow T * F \mid F \quad F \rightarrow (E) \mid a$$
6. (a) What are the basic operations in Shift reduce parser? Find the shift reduce parser algorithm for the input string  $(a, (a, a))$  using following grammar:
- $$S \rightarrow L \mid a, \quad L \rightarrow L, \quad S \mid S$$
- (b) Write a procedure to construct parsing table in SLR parser.
7. (a) Explain about s-attributes and l- attributes with suitable example.
- (b) Translate the expression:  $x = -(a + b) * (c + d) + (a + b + c)$  into (i) Quadruple (ii) Triple (iii) Indirect triple.
8. (a) What is Peephole optimization? Explain different Peep-hole optimization methods.
- (b) What is a leader of basic block? Write an algorithm to find leaders.

[07 BENG - 3212]

III/IV B.Tech. DEGREE EXAMINATION

Second Semester

Computer Science and Engineering

**COMPILER DESIGN**

(Effective from the admitted batch of 2019–2020)

Time : Three hours

Maximum : 70 marks

First question is compulsory.

Answer any FOUR from the remaining questions.

All questions carry equal marks.

Answer ALL parts of any question at one place.

1. Answer the following in brief :

- (a) List and explain few compiler construction tools.
- (b) Define the term 'Tokens' in lexical analysis phase.
- (c) What are the grass of error handless in a parser?
- (d) Write the advantages and disadvantages of operator precedence parsing.
- (e) How can you generate 3-Address code?

- (f) List various forms of Target programs.
- (g) What are the patterns used for code optimization?
2. (a) Explain Single pass and multipass compiler with examples.
- (b) Describe how various phases could be combined as a pass in a compiler.
3. (a) Explain Shift-reduce parsing. What are the conflicts that may occur during shift-reduce parsing?
- (b) For the grammar given below, calculate the operator precedence relation and precedence functions.
- $$E \rightarrow E + E \mid E - E \mid E * E \mid E / E \mid E E \mid (E) \mid -E / id$$
4. Explain 3-address codes and mention its types. How would you implement the three-address statement? Explain with suitable examples.
5. (a) Discuss about allocation strategies of Heap allocation and stack allocation.
- (b) What is Activation record? Explain the purpose of different fields in an activation record.
6. (a) How to trace the data flow analysis of structured program? Explain.
- (b) Explain about Peephole optimization technique.
7. (a) Explain the concept of Syntax directed translation with an example.
- (b) Explain the syntax directed translation of switch statement.
8. Write short notes on the following :
- (a) Code generation algorithm
- (b) Error handling routines in compilers.
- (c) Machine dependent optimization.
